DSA-MST Task Description

- Participants are asked to provide a real-valued score from 1 to 9 for both valence and arousal dimensions

Example 1

Input: ex01, 主治醫師曾經多次強調血液透析和輸血，以病人的狀況就是不建議，已經在加護病房積極治療了兩個禮拜，家屬却遲遲無法達到共識。

Output: ex01, 4.750, 2.750

Example 2

Input: ex02, 視病如親，這個成語一直是一個難以達成的理想，但在ICU我感受到醫療端與病人和家屬站在同一陣線、共同努力對抗病魔，完成病人的願望的努力，讓我十分的動容。

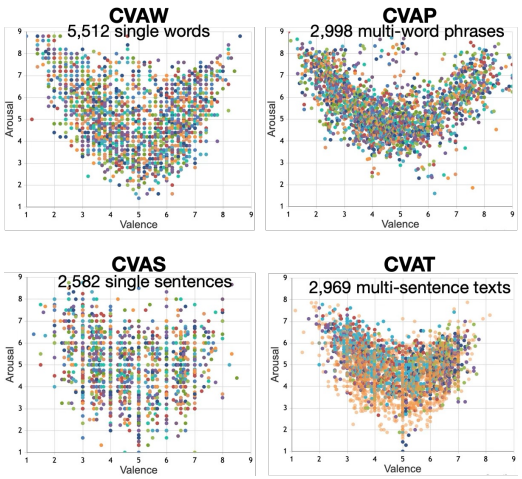
Output: ex02, 6.900, 5.600

DSA-MST Task: Datasets

- Training Set: Chinese EmoBank (Lee et al., 2022)

http://nlp.innobic.yzu.edu.tw/resources/ChineseEmoBank.html

5,512 single words (**CVAW**) + 2,998 multi-word phrases (**CVAP**)
2,582 single sentences (**CVAS**) + 2,969 multi-sentence texts (**CVAT**)



- Validation Set

There are 994 doctors' self-reflection texts for system development.

- Test Set

We will provide at least 1,500 doctors' self-reflection texts for performance evaluation.

DSA-MST Task: Metrics

- Mean Absolute Error (MAE)

$$MAE = \frac{1}{n}\sum_{i=1}^{n}|a_i - p_i|$$

- Pearson Correlation Coefficient (PCC)

$$PCC = \frac{1}{n-1}\sum_{i=1}^{n}\left(\frac{a_i - \mu_A}{\sigma_A}\right)\left(\frac{p_i - \mu_P}{\sigma_P}\right)$$

- A lower MAE and a higher PCC indicate more accurate prediction performance
- Each metric for the valence and arousal dimensions is ranked independently
- The overall ranking is computed based on the cumulative rank across the four metrics. The lower the cumulative rank, the better the system performance

DSA-MST Task: Validation Results

- Validation Results (ongoing)

Baseline model: Regional CNN-LSTM (Wang et al., 20216)

Conclusions & Future Work

- Dimensional Aspect-Based Sentiment Analysis (dimABSA) is a new and challenging research topic, especially dimensional triplet/quadruple extraction (Subtasks 2 &3)

- New datasets in new shared tasks are under construction
